SUMMARY

This Interim Report contains documentation of the work accomplished during Phase I of the Value Engineering Company investigation of pipeline concepts, materials, and construction techniques for the U. S. Army Mobility Equipment Research and Development Command. The objective of Phase I of the investigation was to select those pipeline concepts most technically feasible and suitable for military land transportation of bulk petroleum fuels in a theater of operation under wartime conditions. The process of pipeline concept selection during Phase I consisted of the following steps: (1) Defining the design constraints and pipeline characteristics which control the configuration of a given system concept; (2) Defining the interrelationships between those factors; (3) Researching and describing alternative pipeline concepts; and (4) Selecting those candidate concepts which exhibit the greatest potential for use in the military land transportation of bulk petroleum fuels.

PREFACE

This Interim Report describes Phase I work authorized by the United States Army Mobility Equipment Research and Development Command, Fort Belvoir, Virginia, under contract DAAG53-76-C-0096.

The work detailed herein comprises the definition and preliminary evaluation portions of the investigation of pipeline concepts, materials, and construction techniques. Phase II will involve a more thorough investigation of those pipeline concepts offering the greatest potential for military application.

The results of the investigation and the accompanying recommendations concerning pipeline construction techniques will ultimately be combined with studies on other aspects of the military pipeline design problem to form part of the background research and development material for revised military planning.

INTRODUCTION

Military land transportation and distribution of bulk petroleum products under wartime conditions present complex and demanding engineering criteria for the design of a pipeline system. It is the Army's obligation to meet the numerous requirements imposed in installation and operation. To that end, the purpose of this study is to examine alternative pipeline concepts, and to select those candidates whose material properties, joining methods, and construction techniques most closely meet the following objectives:

1. Maximum system reliability
2. Maximum rate of construction
3. Minimum crew numbers, sizes, and skill levels
4. Minimum total amount of equipment required
5. Minimum total life cycle cost for a complete pipeline system
6. Minimum fuel loss potential
7. Minimum repair and maintenance time

The pipeline concepts selected as a result of the work during Phase I of the investigation will be the subject of a more intensive examination during Phase II, in order to establish a detailed measure of cost and performance for those concepts.

INVESTIGATION

Background and Scope

The bulk fuel supply concept using military pipeline systems has proven to be an effective means for transporting large quantities of liquid hydrocarbon fuels. Nevertheless, the use of coupled pipelines presents various problems with regard to material composition, installation, environment, and other considerations.

Welded steel pipelines currently dominate the industry, yet the welding process requires perfection to assure reliable construction. To date, the Army has been unable to develop and maintain adequate crews of qualified welders to support tactical military operations.

Early development of an automatic pipeline welding machine for use by the Army made little progress. The mobile pipe mill developed by industry in the early 1960's showed promise, but its operation was beset by problems with production rate, reliability, operability, maintainability, maneuverability, transportability, and safety. MERADCOM subsequently recommended termination of the mobile pipe mill development task. Both ideas have since undergone commercial development, but are not the ultimate systems.

The search for a more effective bulk petroleum distribution system, however, has led to use of alternative materials for construction. A Combat Operations Research Group (CORG) study concluded that conventional steel pipe be replaced with buckle-jointed aluminum pipelines. A feasibility study conducted for MERADCOM by Picatinny Arsenal suggested field fabrication of fiberglass reinforced plastic (FRP) pipe as a potential means of military pipeline construction. However, considering only the high throughput requirement and the rate of pipeline construction required for mobile military operation

an effective method of pipeline construction has yet to be determined.

The investigation of various pipeline concepts, materials, and construction techniques suitable for the military under stringent conditions, involves numerous considerations. The scope of the present study necessarily cannot cover all materials, joining techniques, and construction procedures, but did involve a wide range of pipeline designs incorporating accepted industry application criteria. Particular attention was given to various materials used to fabricate the pipeline including metals, plastics, composites and elastomers. Consideration also was given to operation and maintenance levels, personnel required for installation, system reliability and cost.

Phase I of the investigation was, in effect, a four-part study to reduce the large number of possible pipeline concepts to a smaller number of the most promising ideas designated for further analysis. The first part consisted of defining the factors and characteristics to be considered and constraints to be applied in determining the concepts' technical feasibility and military suitability. The next part consisted of establishing the interrelationships between the factors, characteristics, and constraints. The third part involved developing a comprehensive listing of alternative pipeline concepts. The final part of the study was the evaluation of all concepts identified and selection of those pipeline concepts offering the greatest potential for use in a military bulk fuel distribution system environment.

Phase II of the investigation will be the more detailed study of those selected concepts.

Industry Survey

A considerable portion of Phase I effort involved acquisition of data pertaining to pipeline material, installation, and construction techniques. This was necessary to be able to subsequently define the pipeline concepts.

At the outset, 14 companies cited in CORG's Bulk Petroleum Facilities and Systems (BPFS) Report (Reference 1), were contacted so as to update as much as possible the report findings. Appendix B contains a listing of those companies. In addition, manufacturers and suppliers listed in industrial directories under appropriate "pipe" headings were contacted. Of the 774 companies contacted (Appendices B and C), 264 replied, Sixty-seven supplied useful information, and 29 supplied information that was used in the concepts.

Other sources of information consisted of professional and trade organizations, listed in Appendix D, some of whom also furnished membership lists.

Design Constraints and System Characteristics

The factors affecting the design of military pipeline systems were classified as external design constraints and pipeline system characteristics. The external constraints were those factors pertaining more to external physical limitations of the pipeline than the inherent system characteristics. The pipeline's "total length" and "throughput" are examples of external constraints, whereas "pressure loss" is a system characteristic. The factors are listed and defined on the following pages under six major groupings: (1) external constraints, (2) storage, (3) transportation, (4) installation, (5) operation, and (6) pipe physicals. The list represents those parameters considered primary to the pipeline system. It was not intended to be all-inclusive, but rather to reflect professional judgement as to the most significant items.

• External Constraints

Total Length - The total required length in miles of completed pipeline measured from the port of entry to the bulk distribution breakdown point.

Throughput - The daily maximum required quantity of fuel to be passed through the pipeline within 22 hours.

Installation Rate - The speed at which pipeline must be installed (miles/day).

Climate - The climatic conditions at the installation location which affect pipeline installation and operation.

Terrain - The surface features of the installation location which affect pipeline installation and operation.

Hostility Duration - The time span of the wartime conditions under which the pipeline must operate

- Storage

Storage Life - The maximum period of time materials may be stored under probable (storage) conditions without deterioration.

- Transportation

Air Transport - The degree of suitability for air transportation via C-130 aircraft.

Manhandling - The degree of suitability of pipeline components for repeated physical handling by personnel; the maximum allowable weight of materials per man is assumed to be 30 pounds for repeated lifting.

Equipment Required - The types and quantities of equipment required for delivery of pipeline components to the installation site.

- Installation

Number of Crews - The total quantity of crew units required to install the pipeline at the specified installation rate.

Size of Crews - The number of persons required on each installation (joining) crew to meet the specified installation rate with the method employed.

Skill Level - The level of training and practical experience required of each crew member for proper installation of the pipeline.

Safety - The absence or presence of hazards (to personnel) inherent in a particular construction technique.

Equipment required - The types and quantities of equipment required for installation and construction of the pipeline.

Surface vs Buried - The relation with regard to advantage of installed pipeline (below ground) to pipeline installed at ground level.

Joining Method - The construction techniques and mechanical components required to join pipe sections during installation.

Time per Joint - The average elapsed time required by personnel to join two pipe sections during installation and move to the next joint.

Joint Cleanliness - The level of foreign matter present during installation which affects proper joining of pipe sections.

Manhandling - The degree of suitability of pipeline components for physical handling by personnel; the maximum allowable weight of materials per man is assumed to be 30 pounds for repeated lifting.

Reuse components - Those pipeline system components which are capable of being reused in new construction.

Pre-Fab Capability - The possibility of performing some assembly operations prior to stringing the pipe, such as attaching a coupling to one end of each length of pipe, so that only one connection need be made at installation.

Bends vs Fittings - The relation with regard to advantage of the use of bent pipe sections as opposed to the use of separate fittings for directional changes in the pipeline.

Right-of-Way Required - The distance (measured in feet) required on either side of the pipeline for equipment and personnel during installation.

Inspection/Test - The inspection and testing requirements for all components of the completed pipeline.

• **Operation**

Pump Horsepower - The hydraulic horsepower rating required of the pumps used to propel fuel through the pipeline.

Number of Pump Stations - The total quantity of pumping stations required for the total length to pump fuel at the specified rate through the total length.

Pressure Loss - The overall loss of fluid pressure due primarily to friction as fuel passes through pipeline.

Velocity - The average speed of fuel flow necessary to maintain the required rate of flow through the pipeline.

Fluid Temperature - The average temperature of fuel flowing through the pipeline, determined mainly by the climatic conditions of the pipeline location.

Reliability - Probability that the pipeline will continue in operation for a given period of time.

Maintainability - Probability of retaining an item in or restoring an item to operation under a given maintenance policy.

Vulnerability - A measurement of the potential for pipeline operation disruption by external forces (i.e. hostile action).

Service Life - The average expected length of time pipeline components will function before requiring replacement.

Number Parallel Lines - The number of parallel pipelines required to maintain a specified rate of flow.

* Pipe Physicals

Material - Pipe material and its properties (i.e. composition, density).

Product Contamination - The degree to which interior surfaces of pipe couplings and fittings affect the quality of the fluid being pumped through the pipeline.

Working Pressure - Average fluid pressures which fabricated pipe sections must withstand during normal pipeline operation.

Friction Factor - Hazen-Williams coefficient (usually 140-150).

Weight - The average weight (in pounds) of fabricated pipe sections per foot of length.

Diameter - Pipe diameter (in inches).

Wall Thickness - Half the difference between inside and outside pipe diameter dimensions (in inches).

Section Length - Average length (in feet) of fabricated pipe sections.

In addition, certain critical factors were given specified limits by the Government in accordance with their overall program requirements.

These points are listed below:

- o The initial average daily throughput requirement will be not less than 10,000 barrels (420,000 gallons) consisting of a product mix of approximately 10 percent motor gasoline, 15 percent diesel fuel and 75 percent jet fuel.
- o The maximum average daily throughput requirement will not exceed 35,000 barrels (1,470,000 gallons) consisting of a product mix of 20 percent motor gasoline, 30 percent diesel fuel and 50 percent jet fuel.
- o The average distance from the port of entry to the bulk distribution breakdown point will be 100 miles.
- o Construction, operation and maintenance of the pipeline shall be possible in climatic categories 1, 2, 5, 6 and 7 as defined in AR 70-38.
- o The nominal size of each candidate pipeline shall be either 4, 6 or 8 inches. Use of multiple parallel lines to obtain required throughput requirements may be considered as an acceptable concept.
- o All pipeline system components and each item of required construction equipment shall be air-transportable in C-130 aircraft.

Interrelationship of Design Factors

Following the definition of the external design constraints and the pipeline system characteristics, the next objective was the definition of the interrelationships among those factors. To aid in that determination, the factors were arranged in a matrix similar to that shown in Figure 1, as a visual means of readily assessing the interrelationship of the variables considered. The factors were listed as independent variables (row headings), dependent variables (column headings), or both. The external constraints, for example, could only be considered as independent variables. That is, they affected certain aspects of the system design, but in no way were affected by the system design. Conversely, such characteristics as the joining method for the pipe segments were affected by some factors of the system design and, in turn, themselves had a bearing upon others.

The relationships that were determined to be most significant are indicated by the location of the dots in Figure 1, which may be read in the following manner: "The skill level required of the installation crews (the tenth column heading) is a function of the equipment required for installation (the seventeenth row heading), the pipe joining method (the nineteenth row heading), and the suitability of the joining method to either pre-fabrication or pre-assembly (twenty-fourth row heading). As was the case with the original compilation of system design factors, the interactions shown were not intended to be all-inclusive, but were chosen to provide a reasonably constructed tool.

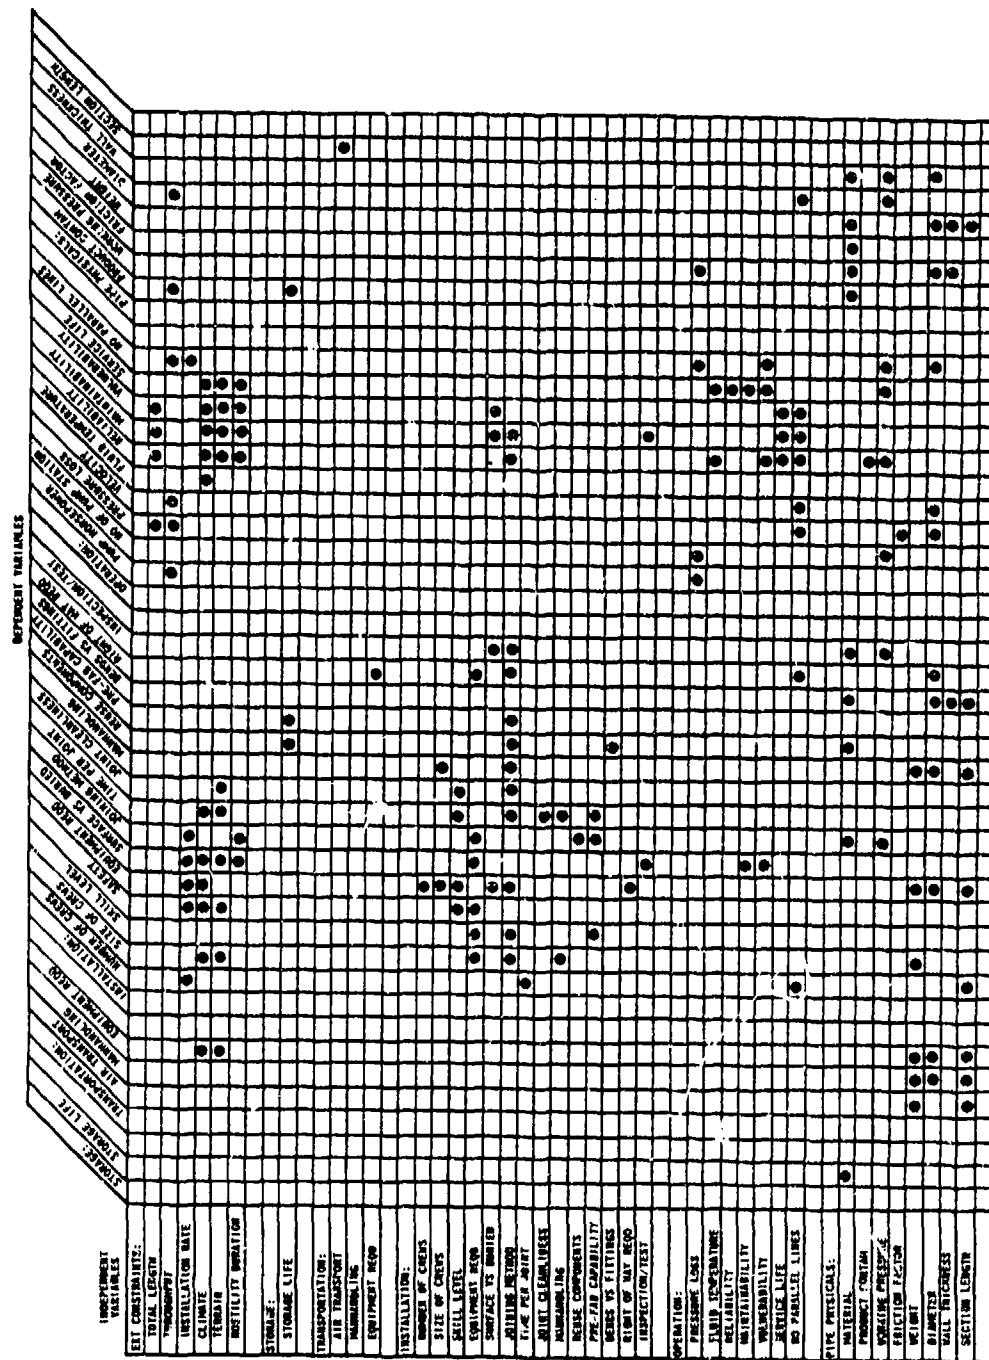

Figure 1: Design Factor Interaction Effects

The functional relationships implied by Figure 1 were written in mathematical terms in the following listing. Those having strict numerical relationships were written as complete equations.

$$\begin{aligned} ST &= f(MA) \\ AT &= f(WE, SL) \\ MT &= f(WE, DI, SL) \\ ET &= f(CL, TN, WE, DI, SL) \end{aligned}$$

$$NC = 8.8 \frac{IR (TJ)(NL)}{SL}$$

NC non-dimensional
IR in mi/day
TJ in min/joint
NL non-dimensional
SL in ft

$$\begin{aligned} SC &= f(CL, TN, EI, JM, MI, WE) \\ SK &= f(EI, JM, PF) \\ SF &= f(IR, CL, TN, SK, EI) \\ EI &= f(IR, CL, NC, SC, SK, SB, JM, RW, WE, DI, SL) \\ SB &= f(IR, CL, TN, HD, EI, IT, MN, VL) \\ JM &= f(IR, HD, EI, RC, PF, MA, WP) \\ TJ &= f(CL, TN, SK, JM, JC, MI, PF) \\ JC &= f(TN, SK, JM) \\ MI &= f(SC, JM, WE, DI, SL) \\ RC &= f(ST, JM, BF, MA) \\ PF &= f(ST, JM) \\ BF &= f(MA, DI, WT, SL) \\ RW &= f(ET, EI, JM, NL, DI) \\ IT &= f(SB, JM, MA, WP) \end{aligned}$$

$$PH = \frac{TP (PL)}{1714}$$

PH in hp
PL in psi
TP in gal/min

$$NP = \frac{PL}{WP}$$

NP non-dimensional
PL in psi
WP in psi

$$PL = 2.05 \times 10^4 TL \left[\frac{TP}{NL(FF)DI} \right]^{1.85}$$

(Based on Hazen-Williams
Equation)

PL in psi
TL in miles
TP in gal/min
NL non-dimensional
FF non-dimensional
DI in inches

$$VE = \frac{.408 TP}{DI^2 (NL)}$$

VE in ft/sec
TP in gal/min
DI in inches
NL non-dimensional

$$FT = f(CL)$$

$$RL = f(TL, CL, TN, HD, JM, FT, VL, SE, NL, PC, WP)$$

$$MN = f(TL, CL, TN, HD, SB, JM, IT, SE, NL)$$

$$VL = f(TL, CL, TN, HD, SB, SE, NL)$$

$$SE = f(CL, TN, HD, FT, RL, MN, VL, WP)$$

$$NL = f(TP, IR, PL, VL, WP, DI)$$

$$PC = f(TP, ST, MA)$$

$$WP = f(PL, MA, DI, WT)$$

$$FF = f(MA)$$

(Hazen-Williams Coefficient,
usually 140-150)

$$WE = 226 MA (SL) (WT)(2 DI + WT)$$

MA in lb/in³ (density)

SL in ft

WT in inches

DI in inches

$$DI = f(TP, NL, WP)$$

$$WT = \frac{WP (DI)}{2 MA + .8 WP}$$

WP in psi

DI in inches

MA in psi (allowable stress)

WP in psi

$$SL = f(AT)$$

These functions were developed primarily as an aid to the detailed definition of system concepts and as such will find more specific application in Phase II of the study. However, for the first phase some of the relations served as indicators to put some points of perspective into the overall system design problem.

For example, given a section length of 40 feet and an installation rate of 18.6 miles per day, the relation shown in Figure 2 indicates how rapidly the total number of installation crews for two 10-hour shifts increases with the time required to make the joints, almost to the point of excluding anything requiring more than 15 to 20 minutes.

Another instance of such a limitation is shown in Figure 3 where, given a throughput of 35,000 barrels per 22-hour day and a total system length of 100 miles, the graph indicates how rapidly the need for additional pumping stations increases with a decrease in working pressure. Related to this requirement are the reliability limits shown in Figure 4 where, even assuming a reliability of 1.00 for the pipeline itself, it can be seen for example, that if a system required 16 or more pumping stations, the overall system reliability could not exceed .85.

Scoring Values

In order to employ the interrelationships or interactions between the design factors as a tool for comparison of the concepts, it was necessary to assign a value to each of the 162 relationships shown in Figure 1. Then each pair of concepts could be compared on the basis of each interaction.

The method which was employed is as follows:

(1) Each row entry was assigned a value based upon the number of designated interactions in that row. For example, the row labelled "Joining Method" has 12 interactions. The independent variable "Joining Method:", therefore, has a value of 12/162 on the basis of the 162 possible interactions.

(2) Each column entry was given a value based upon the number of interactions in that column and the values from step (1) of each of the rows interacting in that column. For example, the column labelled "Size of Crews" has six interactions whose row values total 47/162. The dependent variable "Size of Crews" then has a value of 6/(47/162).

(3) The value for each individual interaction then was taken as the normalized product (rounded-off) of the row and column values. Using the same example as in steps (1) and (2) above, the product is $(12/162)$ times $[6/(47/162)]$ or 1.532. Normalizing on the maximum possible value of 2.000 (which occurs at the interaction of "Service Life" as a function of "Climate") the scoring value for the example is $(1.532/2.000)10 = 7.66$ or, rounded off, 8, as shown in Figure 5 at the interaction of "Size of Crews" as a function of "Joining Method".

After the results were compiled, each interaction value was examined for plausibility. Any anomalies were reconciled through re-examination of the definitions of variables involved.

Figure 5: Scoring Matrix

Evaluation of Concepts

Due to the large number of concepts defined, the number of interactions shown in Figure 5, and the incompleteness of the data for some concepts, it was decided that a more basic set of design evaluation criteria than that of Figure 5 should be used to reduce the field of candidates. It was imperative, however, that as many variables as possible be considered.

The abbreviated matrix shown in Figure 6 was developed for this purpose. It required the specification of only four independent variables (joining method, pipe material, working pressure, and weight), yet those four had a bearing upon 27 of the 36 dependent variables. The values used for each of the interactions were the same as those assigned in the full matrix.

Using this chart the concepts, taken in pairs, were scored by comparison. That is, the attributes of the two concepts were compared in each of the 36 points of consideration. In each instance the concept having the superior characteristics received the scoring value. In the case of equal qualifications or where sufficient data was unavailable, both concepts were awarded the value. Thus, the significance of the two total concept scores was not their magnitudes, but the difference between them.

Figure 6: Abbreviated Scoring Matrix

Results

The results of the Phase I investigation were the accumulation of a considerable amount of useful and current information on pipeline systems and installation methods and techniques, the definition of system concepts, the development of concept evaluation tools, and the selection of four concepts for further investigation.

DISCUSSION

Update of BPFS Findings

The BPFS Report was used as background information, and an attempt was made to contact all companies mentioned in the report in order to update the data and determine the extent of new developments in areas pertaining to piping, hardware, and welding techniques. Any additional information available on materials, joining devices and methods, and high speed pipeline construction methods also was solicited.

Of the 14 companies mentioned in the BPFS Report (see Appendix B) Mobile Pipe Constructors, manufacturer of a mobile pipe mill, and Frieberg and Fonnbeck, who were suppliers of a spiral weld tube mill, could not be located. Amercoat failed to reply to inquiries pertaining to FRP pipe systems and Westinghouse did not reply with information on its automatic welder.

Three companies indicated no further development of products since 1969. They are Aerojet-General with respect to explosive welding ("Shock-weld"), and Reynolds Aluminum and Rockwell International (North American Rockwell) with respect to automatic welders.

However, based on responses received, it was determined that six companies' products are currently available commercially. CIBA-Geigy (referenced in the BPFS Report as CIBA Products) currently has FRP pipe systems on the market as does A. O. Smith. Gustin-Bacon's and Victaulic's grooved pipe couplings, Race and Race's coupled hose/pipe and Zapata's (referenced as Anbeck's) "Buckle-Joint" are available commercially. It also was determined that CRC Automatic Welding (CRC-Crouse International) has developed an automatic welder applicable down to 24 inch diameter and

is currently working on applications in the 12-24 inch diameter range.
All data furnished for currently available items was examined and incorporated in the concepts considered.

Concepts Defined

On the basis of data obtained from the companies contacted, 39 pipeline concepts (see Appendix A) were identified and defined, collectively employing an assortment of conduit material and joining methods and techniques. The only systems eliminated from further consideration employed glass, wood, concrete, or lead pipe and, therefore, were not suitable for the specified military application.

Of the concepts selected for consideration, all employed either metallic pipe, non-metallic pipe, or hose. Joining methods included welding, adhesive bonding, couplings, friction, or mechanical means.

For purposes of identification a five-digit hexadecimal number was assigned to each concept, each digit representing a characteristic or parameter. The chart which follows (Figure 7) presents an explanation of the code. For example, the 2 in the identification code 2173D signifies the concept status (proposed during this study); the 1 indicates the joining method (mechanical coupling); the 7 indicates the joint geometry (separate fittings); the 3 indicates the joint description (thermal welding); and the D indicates the conduit material (polypropylene pipe).

Recognizing that application of any concept would fall into the near time-frame, it was necessary to consider only those concepts either commercially available now in the form specified or those requiring only adaptation or modification of equipment to meet the criteria. Any long-term process development was not deemed feasible, hence, no concepts requiring that type of development were considered.

Concepts defined included five systems currently used by the military: concepts 11112, 12342, 12343, 1234E, and 1240E (reference Appendix A). Three employ steel pipe and two use synthetic rubber hose; four are joined by

mechanical couplings and one welded; three couplings are bolted and one coupling employs a cam and groove catch.

JOINT GEOMETRY

- 0 - Not applicable
- 1 - V-groove butt joint
- 2 - Plain end butt joint
- 3 - Grooved pipe
- 4 - Cam-and-groove coupling
- 5 - Bell-and-spigot
- 6 - Flanged
- 7 - Separate Fittings
- 8 - Tongue-and-groove
- 9 - Swaged-on grooved pipe fittings

JOINING METHOD

- 1 - Welding
- 2 - Mechanical coupling
- 3 - Adhesive bonding
- 4 - Friction coupling
- 5 - Continuous conduit (Few joints)

CONCEPT STATUS

- 1 - Presently used by military
- 2 - Proposed during this study

FIVE-DIGIT CODE

(Figure 7 cont'd)

Results of Evaluation

The results of the evaluation of the concepts using the scoring matrix of Figure 6 is shown in Figure 8. There the concepts which were paired for comparison at the various stages of the elimination process are shown with their relative scores.

In Figure 8, three concepts (2123C, 2173D, and 2458C) received scores of zero. This was due to the fact that the materials involved, high density polyethylene (HDPE) and polypropylene, were found not to be compatible with the applicable petroleum products throughout the specified environmental temperature range. The merits or shortcoming of some of the other system concepts are listed below.

System Concept	Features	Disadvantages
11112	Reliability, Working Pressure	Skill level, Inspection, Time
12342	Skill level	Time, Weight
12343	Skill level, Weight	Working pressure, Vulnerability
1234E	Skill level, Time	Working pressure, Vulnerability
1240E	Skill level, Time, Weight	Working pressure, Reliability
21122	Reliability, Weld Quality	Skill level, Time
220DB	Skill level, Time, Weight	Working pressure

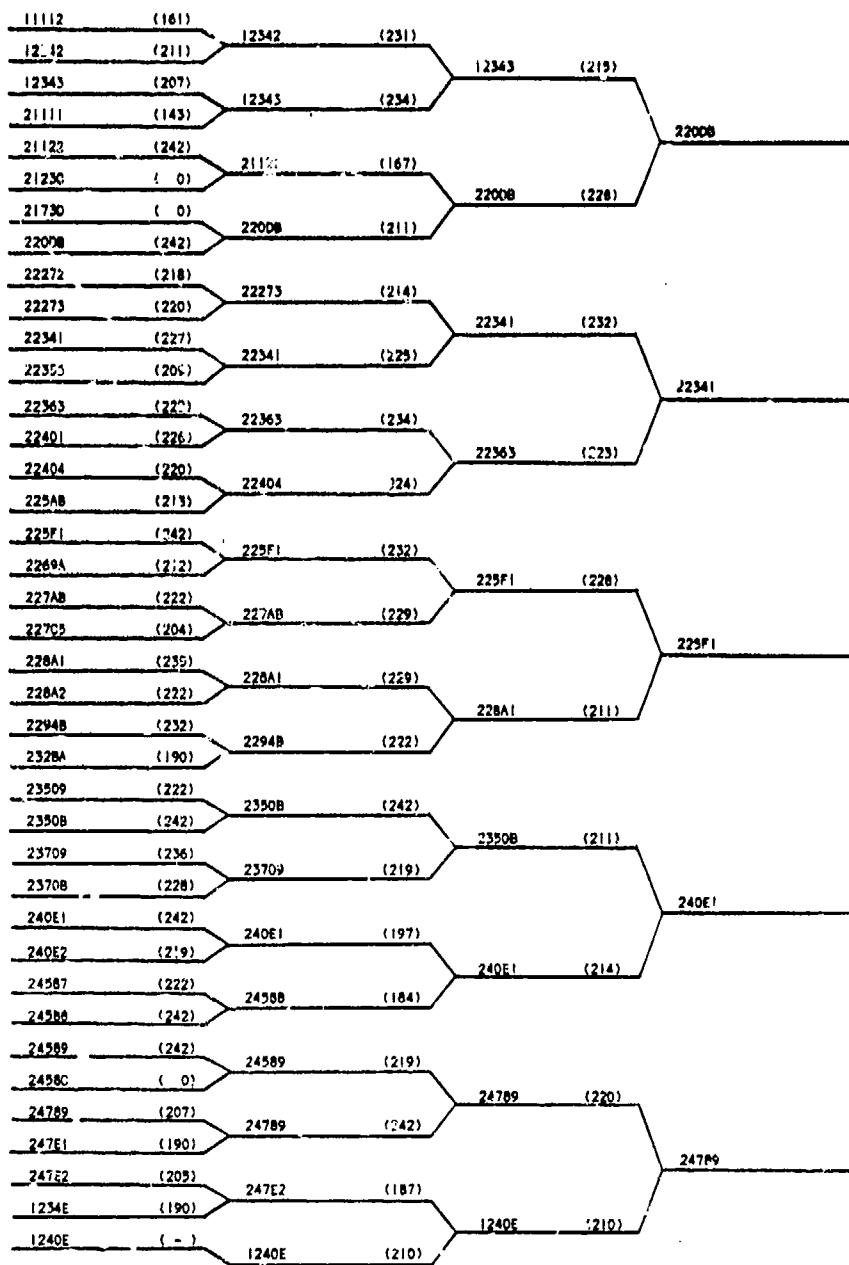

Figure 8: Elimination Scoring Results

22341	Skill level, Working pressure	Time, Vulnerability
22363	Skill level, Time	Working pressure, Vulnerability
225F1	Skill level, Time, Weight	Working pressure
228A1	Time, Weight, Working pressure	Skill level, Equipment required
23508	Working pressure, Weight	Time
240E1	Working pressure, Weight, Time	Skill level, Equipment required
24789	Skill level, Weight, Time	Working pressure, Reliability

The details of the scoring in each comparison are shown in Appendix E.

The five concepts which survived the elimination process are shown in Figures 9 through 13. In general, the qualities exhibited by all five were relatively light weight, relatively fast joining times, and relatively low skill levels required. This was, however, accomplished at the expense of lower operating pressures and increased vulnerability in some cases.

Comparison to Existing Systems

Since the present military systems were not represented in each major branch of Figure 8, it was necessary to rate each of the five proposed concepts against each of the five present systems in order to establish their relative merit. The results of this are shown in Figure 14. In every case it can be seen that using the limited criteria established, the proposed concepts outweigh the present systems. The numbers in parentheses below the proposed concept codes are the total of the differences between the concepts scores and the present systems' scores. The details of the scoring of each comparison are shown in Appendix F.

		PRESENT MILITARY SYSTEMS				
		I1112	I2342	I2343	I234E	I240E
PROPOSED CONCEPTS	220DB (117)	172 222	215 228	215 228	207 223	207 232
	2234I (117)	180 228	227 242	223 242	195 222	215 223
	225F1 (130)	180 220	204 220	208 228	205 232	215 242
	240E1 (135)	199 242	173 205	180 205	183 208	200 210
	24789 (113)	183 222	199 222	207 222	194 220	210 220

Figure 14: Present Systems Compared to Proposed Concepts

Concepts Selected

The four concepts selected are those with the highest scoring values overall and represent those concepts remaining after the evaluation process which indicate, on the basis of performance, the greatest potential for military application. The four concepts, 220DB, 22341, 225FI, and 240EI, on the basis of initial assessment, would meet the specified criteria. Three employ aluminum pipe, while one uses fiberglass reinforced plastic pipe. All are joined by methods basically available commercially.

The fifth concept from Figure 14 was eliminated from further consideration because of its lower scores and due to anticipated seepage rates higher than would be acceptable. That is, in the usual application for that type of pipe (water lines), relatively high seepage at the joints is allowed as the minimum quality level of the pipe. Development of that concept would, therefore, require changes in specified tolerances, manufacturing methods, and/or the geometry of the proprietary seal involved. While this could undoubtedly be accomplished, the other four concepts do not have problems of this nature.

Future Actions

The Phase II investigation will assess, in detail, the effectiveness for each of the four selected pipeline concepts as components of the overall system for the distribution of bulk fuel. Particular attention will be directed to costs involved.

CONCLUSIONS

The Phase I investigation has yielded the following conclusions:

- o On the basis of contact with professional and trade organizations and private industry, only a few areas of pipeline technology have shown marked progress or development in the last several years. For example, automatic welding techniques have improved the quality of joints, but because there has been no reduction in time required, rapid pipeline installation is not possible. Hose is relatively versatile, can be easily transported and installed, but its application is limited by its low working pressures.
- o As a result of the information obtained and on the basis of preliminary findings, the development of an effective concept for rapid installation of a system for distribution of bulk fuel appears feasible.
- o All four concepts under consideration appear to be superior, on the limited basis of the preliminary evaluation to the military systems currently available.

APPENDIX A

Descriptions of Concepts

Concept Code 11112

Description: This concept code represents a pipeline type currently used by the military. It employs steel, API 5L pipe, grade A or B, joined by manual welding. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 10.00 LB/FT, 14.97 LB/FT, and 22.34 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi, and 1000 psi, respectively.

Concept Code 12342

Description: This concept code represents a conventional type pipeline employing steel, API 5L pipe grade A or B, with grooved pipe couplings, such as, Victaulic style 77 or Gustin-Bacon No. 100 bolted couplings. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 10.00 LB/FT, 14.97 LB/FT, and 22.34 LB/FT, respectively; corresponding working pressures are 1000 psi, 1000 psi, and 800 psi, respectively.

Concept Code 12343

Description: This concept code represents a conventional type pipeline employing lightweight steel tubing with welded end nipples. The joining method is the same as that used in concept code 12342, above. Weights of 4 inch, 6 inch and 8 inch diameter tubing are 3.53 LB/FT, 7.28 LB/FT, and 9.51 LB/FT, respectively; corresponding working pressures are 600 psi, 600 psi, and 500 psi, respectively.

Concept Code 1234E

Description: This concept code represents a pipeline type currently used by the military. It employs synthetic rubber hose assemblies as covered by MIL-H-52262, joined by grooved pipe couplings. Weight of 4 inch diameter hose is 1.65 LB/FT, with a working pressure of 125 psi (500 burst/225 proof).

Concept Code 1240E

Description: This concept code represents a pipeline type currently used by the military. It employs synthetic rubber hose assemblies as covered by MIL-H-82127, joined by car and groove couplings. Weights of 4 inch and 6 inch diameter hoses are 1.25 LB/FT and 2.3 LB/FT, respectively; corresponding working pressure is 100 psi for both diameters (400 burst/200 proof).

Concept Code 21111

Description: This concept code represents a proposed pipeline employing aluminum, schedule 40, 6061-T6 pipe, joined by manual welding. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 3.73 LB/FT, 6.56 LB/FT, and 9.88 LB/FT, respectively; corresponding working pressures are 1000 psi, 800 psi, and 650 psi, respectively.

Concept Code 21122

Description: This concept code represents a proposed pipeline employing steel, API 5L pipe, grade A or B, joined by automatic welding equipment, such as, that available from Dimetricals, Astro-Arc, or Sclaky Bars. Weights of 4 inch, 5 inch, and 8 inch diameter pipes are 10.0 LB/FT, 14.97 LB/FT, and 22.34 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi, and 1000 psi, respectively.

Concept Code 21230

Description: This concept code represents a pipeline employing high density polyethylene (HDPE) pipe, joined by thermal welding, such as Ryerson "Monoline" and M. L. Sheldon "Sclairpipe". Weights of 4 inch, 6 inch, and 8 inch pipe are 2.77 LB/FT, 5.99 LB/FT, and 9.35 LB/FT, respectively; corresponding working pressure is 150 psi for all diameters.

Concept Code 2173D

Description: This concept code represents a pipeline employing Schedule 40 polypropylene pipe, joined by thermally welded, separate fittings (R & G Sioane "Fuseal"). Weight of 4 inch and 6 inch diameter pipes are 1.87 LB/FT and 3.56 LB/FT, respectively; corresponding working pressures are 125 psi and 100 psi, respectively.

Concept Code 220DB

Description: This concept code represents a proposed pipeline employing epoxy resin fiberglass reinforced plastic pipe, joined by CIBA-Geigy "Pronto-Lock" and "Pronto-Lock II" male/female integral threaded couplings. Weights for 4 inch, 6 inch, and 8 inch diameter pipes are 0.8 LB/FT, 1.7 LB/FT, and 3.3 LB/FT, respectively; corresponding working pressures are 300 psi, 200 psi, and 150 psi, respectively.

Concept Code 22272

Description: This concept code represents a proposed pipeline employing steel, API 5L pipe, Grade A or B, joined by Gustin-Bacon No. 200 bolted gripping couplings. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 10.00 LB/FT, 14.97 LB/FT, and 22.34 LB/FT, respectively; corresponding working pressures are 1000 psi, 600 psi, and 500 psi, respectively.

Concept Code 22273

Description: This concept code represents a proposed pipeline employing lightweight steel tubing, joined by the same mechanical coupling as that used in Concept Code 22272, above. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 3.53 LB/FT, 7.28 LB/FT, and 9.51 LB/FT, respectively; corresponding working pressures are 600 psi, 600 psi, and 500 psi, respectively.

Concept Code 22341

Description: This concept code represents a proposed pipeline of a type not currently used by the military. Conduit material is aluminum, schedule 40, 6061-T6. Sections are joined by grooved pipe couplings, such as, Gustin-Bacon No. 101 bolted coupling. Weights of 4 inch, 6 inch, and 8 inch diameter pipe are 3.73 LB/FT, 6.56 LB/FT, and 9.88 LB/FT, respectively; corresponding working pressures are 1000 psi, 1000 psi, and 800 psi, respectively.

Concept Code 22356

Description: This concept code represents a proposed pipeline employing spiral-welded steel pipe, joined by Naylor "WedgeLock" wedge locking grooved-pipe couplings. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 3.96 LB/FT, 7.94 LB/FT, and 13.20 LB/FT, respectively; corresponding working pressure is 400 psi for each diameter.

Concept Code 22363

Description: This concept code represents a proposed pipeline of a type not currently used by the military. Conduit material consists of lightweight steel tubing with welded end nipples. Sections are joined by latching grooved pipe couplings, such as, Victaulic style 78 or Gustin-Bacon No. 115. Weights of 4 inch, 6 inch, and 8 inch diameter tubing are 3.53 LB/FT, 7.28 LB/FT, and 9.51 LB/FT, respectively; corresponding working pressures are 300 psi, 300 psi, and 300 psi, respectively.

Concept Code 22401

Description: This concept code represents a proposed pipeline employing aluminum, schedule 40, 6061-T6 pipe, joined by cam and groove type couplings, such as, Andrews 400A, 400D, 600A, 600D, 800A, 800D, or OPW 633-A, 633-D NPT female threads (aluminum). Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 3.73 LB/FT, 6.56 LB/FT, and 9.88 LB/FT, respectively; corresponding working pressures are 100 psi, 75 psi, and 50 psi, respectively.

Concept Code 22404

Description: This concept code represents a proposed pipeline employing steel, schedule 40 pipe, joined by cam and groove type couplings, such as, Andrews 400A, 400D, 600A, 600D, 800A, 800D or OPW 633-A, 633-D NPT female threads (steel). Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 10.79 LB/FT, 18.97 LB/FT, and 28.55 LB/FT, respectively; corresponding working pressure is 100 psi for the 4 and 6 inch diameters.

Concept Code 224AB

Description: This concept code represents a proposed pipeline employing filament wound epoxy resin fiberglass reinforced plastic pipe, joined by bell and spigot coupling with locking key strip, such as those available from Brunswick and Fiberglass Resources.

Concept Code 225FI

Description: This concept code represents a proposed pipeline employing aluminum 6063-T63 pipe, joined by Race and Race "Racebitt" bell and spigot coupling with "O" ring and latching lugs. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 1.35 LB/FT, 3.06 LB/FT, and 4.64 LB/FT, respectively; corresponding working pressure is 350 psi for each diameter.

Concept Code 2269A

Description: This concept code represents a proposed pipeline employing filament wound polyester resin fiberglass reinforced plastic (FRP) pipe, joined by Beetle "Quick-Lock" flange clamp with "O" ring. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 1.5 LB/FT, 2.7 LB/FT, and 4.1 LB/FT, respectively; corresponding working pressures are 200 psi, 200 psi, and 150 psi, respectively.

Concept Code 227AB

Description: This concept code represents a proposed pipeline employing epoxy resin fiberglass reinforced plastic pipe, joined by Fiberglass Resources' "Kwik-Key" coupling with "O" ring and locking strip. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are .8 LB/FT, 1.6 LB/FT, and 2.7 LB/FT, respectively; corresponding working pressures are 350 psi, 250 psi, and 260 psi, respectively.

Concept Code 227C5

Description: This concept code represents a proposed pipeline employing high strength well casing steel pipe, joined by Armco "Seal Lock" threaded well casing couplings. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 11.60 LB/FT, 23.00 LB/FT, and 32.00 LB/FT, respectively; corresponding working pressures are 2100 psi, 1700 psi, and 1500 psi, respectively.

Concept Code 228A1

Description: This concept code represents a proposed pipeline employing aluminum, schedule 40 pipe, joined by Sandia Labs' male/female tongue and groove coupling with locking strips ("Taped Joint"). Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 3.73 LB/FT, 6.56 LB/FT, and 9.88 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi, and 1000 psi, respectively.

Concept Code 228A2

Description: This concept code represents a proposed pipeline employing steel, API 5L pipe, Grade A or B, joined by the same coupling as that used in Concept Code 228A1, above. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 10.00 LB/FT, 14.97 LB/FT, and 22.34 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi, and 1000 psi, respectively.

Concept Code 2294B

Description: This concept code represents a proposed pipeline employing epoxy resin fiberglass reinforced plastic pipe, joined by "Gamagrip" swaged-on grooved pipe couplings. Weights of 4 inch and 6 inch diameter pipes are .8 LB/FT and 1.7 LB/FT, respectively; corresponding working pressures are 225 psi and 250 psi, respectively.

Concept Code 232BA

Description: This concept code represents a proposed pipeline employing filament wound polyester resin fiberglass reinforced plastic (FRP) pipe, joined by butt and strap hand lay-up of resin and mat, such as that available from Century Fiberglass. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 1.5 LB/FT, 2.7 LB/FT, and 4.1 LB/FT, respectively; corresponding working pressure is 150 psi for each diameter.

Concept Code 23509

Description: This concept code represents a proposed pipeline employing polyvinyl chloride (PVC) pipe, joined by cemented (adhesive bonded) bell and spigot couplings, such as those available from Certain-Teed. Weights of 4 inch and 6 inch diameter pipes are 1.822 LB/FT and 3.947 LB/FT, respectively; corresponding working pressure is 200 psi for both diameters.

Concept Code 2350B

Description: This concept code represents a proposed pipeline employing epoxy resin fiberglass reinforced plastic pipe, joined by cemented (adhesive bonded) bell and spigot couplings, such as those available from Fiberglass Resources, Fiber Cast, and Koch. Weights for 4 inch, 6 inch and 8 inch diameter pipes are .8 LB/FT, 1.6 LB/FT, and 2.7 LB/FT, respectively; corresponding working pressures are 350 psi, 250 psi, and 260 psi, respectively.

Concept Code 23709

Description: This concept code represents a proposed pipeline employing polyvinyl chloride (PVC) pipe, joined by cemented (adhesive bonded) fittings, such as those available from Certain-Teed and Dixie Plastics. Weight of 4 inch, 6 inch, and 8 inch diameter pipes are 1.822 LB/FT, 3.947 LB/FT, and 6.679 LB/FT, respectively; corresponding working pressure is 200 psi for each diameter.

Concept Code 2370B

Description: This concept code represents a proposed pipeline employing epoxy resin fiberglass reinforced plastic (FRP) pipe, joined by Conley FRP cemented (adhesive bonded) fittings. Weights for 4 inch, 6 inch, and 8 inch diameter pipes are .8 LB/FT, 1.6 LB/FT, and 2.7 LB/FT, respectively; corresponding working pressure is 150 psi for each diameter.

Concept Code 240E1

Description: This concept code represents a proposed pipeline employing aluminum, schedule 40, 6061-T6 pipe, joined by Zapata "Zap-Lok" swaged bell and spigot friction coupling. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 3.73 LB/FT, 6.56 LB/FT, and 9.88 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi, and 1000 psi, respectively.

Concept Code 240E2

Description: This concept code represents a proposed pipeline employing steel, API 5L pipe, Grade A or B, joined by the same method as that used in Concept Code 240E1, above. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 10.00 LB/FT, 14.97 LB/FT, 22.34 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi, and 1000 psi, respectively.

Concept Code 24587

Description: This concept code represents a pipeline employing cast iron pipe, joined by a bell and spigot type friction joining mechanism with an "O" ring seal, such as McWane "Tyton" and American "Fastite". Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 15 LB/FT, 23.9 LB/FT, and 34.7 LB/FT, respectively; corresponding working pressure is 350 psi for each diameter.

Concept Code 24588

Description: This concept code represents a pipeline employing ductile iron pipe, joined by a bell and spigot type friction joining mechanism with an "O" ring seal, such as McWane "Tyton" and American "Fastite". Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 13.4 LB/FT, 21 LB/FT, and 29.7 LB/FT, respectively; corresponding working pressure is 350 psi for each diameter.

Concept Code 24589

Description: This concept code represents a proposed pipeline employing polyvinyl chloride (PVC) pipe, joined by bell and spigot coupling with rubber seal, such as ASC Plastics' "Vulcan" with integral coupler; Certain-Teed "Fluid-Tite"; Clow "Bell-Tite"; Ethyl "Bell-Ring"; Johns-Manville "Ring-Tite"; Rehau "Mechan-O-Joint". Weights for 4 inch, 6 inch, and 8 inch diameter pipes are 1.86 LB/FT, 4.05 LB/FT, and 6.91 LB/FT, respectively; corresponding working pressure is 200 psi for each diameter.

Concept Code 2458C

Description: This concept code represents a pipeline employing high density polyethylene (HDPE) duct, with a bell and spigot type friction joining mechanism with an "O" ring seal, such as Phillips Products "Driscon 3700". Weights for 4 inch and 6 inch line are .96 LB/FT and 1.82 LB/FT, respectively; corresponding working pressure is 75 psi for both diameters.

Concept Code 24789

Description: This concept code represents a proposed pipeline employing polyvinyl chloride (PVC) pipe, joined by Tridyn "Wedge-Tite" friction coupling with rubber seal. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 1.48 LB/FT, 3.22 LB/FT, and 5.44 LB/FT, respectively; corresponding pressure is 200 psi for each diameter.

Concept Code 247E1

Description: This concept code represents a proposed pipeline employing aluminum schedule 40, 6061-T6 pipe, joined by McDonnell "Duraswage" swaged friction couplings. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 3.73 LB/FT, 6.56 LB/FT, and 9.88 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi, and 1000 psi, respectively.

Concept Code 247E2

Description: This concept code represents a proposed pipeline employing steel, API 5L pipe, Grade A or B, joined by the same method as that used in Concept Code 247E1, above. Weights of 4 inch, 6 inch, and 8 inch diameter pipes are 10.00 LB/FT, 14.97 LB/FT, and 22.34 LB/FT, respectively; corresponding working pressures are 1700 psi, 1200 psi and 1000 psi, respectively.
